

```
1-git clone https://github.com/openvinotoolkit/openvino_notebooks.git
2-cd openvino_notebooks
conda create -n openvino_env python=3.8
```

```
3-conda activate openvino_env
```

```
4-# Upgrade pip to the latest version to ensure compatibility with all dependencies
python -m pip install --upgrade pip==21.3.*
pip install -r requirements.txt
```

5-Depending on your Conda installation, this step may be required at the moment for conda environments on Windows. In a future OpenVINO version this should no longer be necessary.

The command below assumes that Miniconda is installed in the default location: C:\Users\<username>\Minoconda3, where <username> is your Windows username. If you installed Anaconda, replace Miniconda3 with Anaconda3. If you installed Anaconda or Minoconda in a different location, you can run `python -c "import os,sys;print(os.path.dirname(sys.executable))"` to find the path to `openvino_env`. Note that at the moment you need to run this command again if you open a new Anaconda Prompt to run the notebooks. You can add this folder to your PATH for every command prompt you open, by following [these steps](#) on Microsoft's website. Note however, that this may cause issues if you have multiple OpenVINO versions installed.

```
set PATH=C:\Users\<username>\Miniconda3\envs\openvino_env\Lib\site-
packages\openvino\libs;%PATH%
```

```
6-# To launch a single notebook
jupyter notebook <notebook_filename>
```

```
# To launch all notebooks in Jupyter Lab
jupyter lab notebooks
```
